Compulsory Vaccinations

Putting aside the Human Rights issue of allowing an individual or a parent to choose for themselves or their dependents I was deeply troubled by public health expert Sir Sandy Macara's unopposed declaration of support for compulsory MMR vaccination pre-school entry. His submission of a motion for debate at the annual BMA conference later this month is unlikely to have much opposition as "conventional wisdom" has clearly refuted the current science behind the anti-MMR vaccination. I fear the proposal that will be put before Health Ministers (before expenses!) will be to introduce compulsory vaccination despite the BMA being the evolution of the same body of authority that allowed and encouraged the use of drugs like Thalidomide and the indiscriminate use of HRT in women before such drugs and treatments were predominantly withdrawn.

The Diagnostic Clinic is certainly NOT against vaccinations but there remains evidence that vaccinations can harm some individuals and sound theories behind why.

The Diagnostic Clinic Vaccination Statement appears below and touches on the MMR controversy, a question of whether to vaccinate a child and the mercury controversy associated with vaccinations (albeit that this preservative is now being replaced with aluminium).

For a government to create a compulsory treatment programme with the use of a theoretically dangerous compound, according to some sources, opens the door to the potential of compulsory therapy for other diseases with other drugs with other potential risks. Wouldn't it be nice if the same government would look closely at the facts and see that compulsory prescriptions of Vitamin D could cut down juvenile diabetes by 30% or more, compulsory Food State supplements could cut down cardiovascular disease, heart attacks and strokes, compulsory supplementation with minerals could cut down osteoporosis, compulsory exercise would enhance protection against all of the above and many other diseases...
